Final Report

Hongye Xu

2019/5/5

1 Introduction

1.1 Background

I have always felt that the NBA has the best data storage in the sport filed. In the beginning, I wanted to analyze the performance of the players by scrapping the data from the official NBA.stat website. However, since the NBA.stat table is in javascript format, and the official has canceled all the existing official APIs, no possible R-based crawler method has been found after the effort. Therefore, I chose an alternative, which is the basketball-reference website. This report is based on two data sources on the basketball-reference. My goal is to predict the player's salary for next season based on player performance this season.

1.2 Glossary

Table Header	Second Header
Pos	Position
Age	Age of Player at the start of February 1st of that season
Tm	Team
G	Games
GS	Games Started
MP	Minutes Played Per Game
FG	Field Goals Per Game
FGA	Field Goal Attempts Per Game
FG%	Field Goal Percentage
3P	3-Point Field Goals Per Game
3PA	3-Point Field Goal Attempts Per Game
3P%	FG% on 3-Pt FGAs.
2P	2-Point Field Goals Per Game

2PA	2-Point Field Goal Attempts Per Game
eFG%	Effective Field Goal Percentage
FT	Free Throws Per Game
FTA	Free Throw Attempts Per Game
FT%	Free Throw Percentage
ORB	Offensive Rebounds Per Game
DRB	Defensive Rebounds Per Game
TRB	Total Rebounds Per Game
AST	Assists Per Game
STL	Steals Per Game
BLK	Blocks Per Game
TOV	Turnovers Per Game
PF	Personal Fouls Per Game
PTS	Points Per Game

2 Preparation

2.1 Required Packages

```
library(rvest)
library(magrittr)
library(tibble)
library(dplyr)
library(stringr)
library(data.table)
library(corrplot)
library(GGally)
library(tidyverse)
library(PerformanceAnalytics)
library(plotly)
```

2.2 Data Scraping and Cleaning

2.2.1 Players' Regular Season Data

```
#NBA Season18-19 Players stat(Regular Season)
url<- "https://www.basketball-reference.com/leagues/NBA_2019_per_game.html"
player_season_v1 <- url %>% read_html()%>%
  html_nodes(xpath = '//*[@id="per_game_stats"]')%>%
  html_table()
```

```
# romove the rank column and row number
player_season_v2 <- player_season_v1[[1]]%>%select(-Rk)
player_season_v3 <-player_season_v2[- grep("Player", player_season_v2$Player),]
# make some columns numeric
name <- c("Age","G","GS","MP","FG","FGA","FG%","3P","3PA","3P%","2P","2PA","2P%","eFG
%","FT","FTA","FT%","ORB","DRB","TRB","AST","STL","BLK","TOV","PF","PTS")
player_season_v3[name] <- sapply(player_season_v3[name],as.numeric)
rownames(player_season_v3) <- NULL

# There will be multiple rows of data for players transferred during the season. We o
nly keep the one with the largest number of games played(which is the stat of this pl
ayer throughout the season).
player_season_tidy <- player_season_v3 %>% group_by(Player)%>%
   mutate(rank = min_rank(desc(G))) %>%
   filter(rank == 1) %>%
   select(-rank)
# No Scale data(for data visulization)
player_season_tidy <- player_season_tidy %>% filter(!is.na(`3P%`) & !is.na(`FT%`)& !i
s.na(`2P%`)) %>% as.data.frame(.)
head(player_season_tidy)
```

```

2.2.2 Scale

Considering that regression analysis is mainly used in this report, i try to scale some features.

```
#Here i use the Player column as the rowname since the scale function need the whole matrix features to be numeric
scale <- player_season_tidy %>% select(Player ,Age,MP,`2P%`,`3P%`,`FT%`,TRB:PTS)
rownames(scale)<-scale[,1]
scale1 <- scale[,-1]%>% as.matrix(.)%>%
  scale(.) %>%
  as.data.frame(.)
head(scale1)
```

```

```

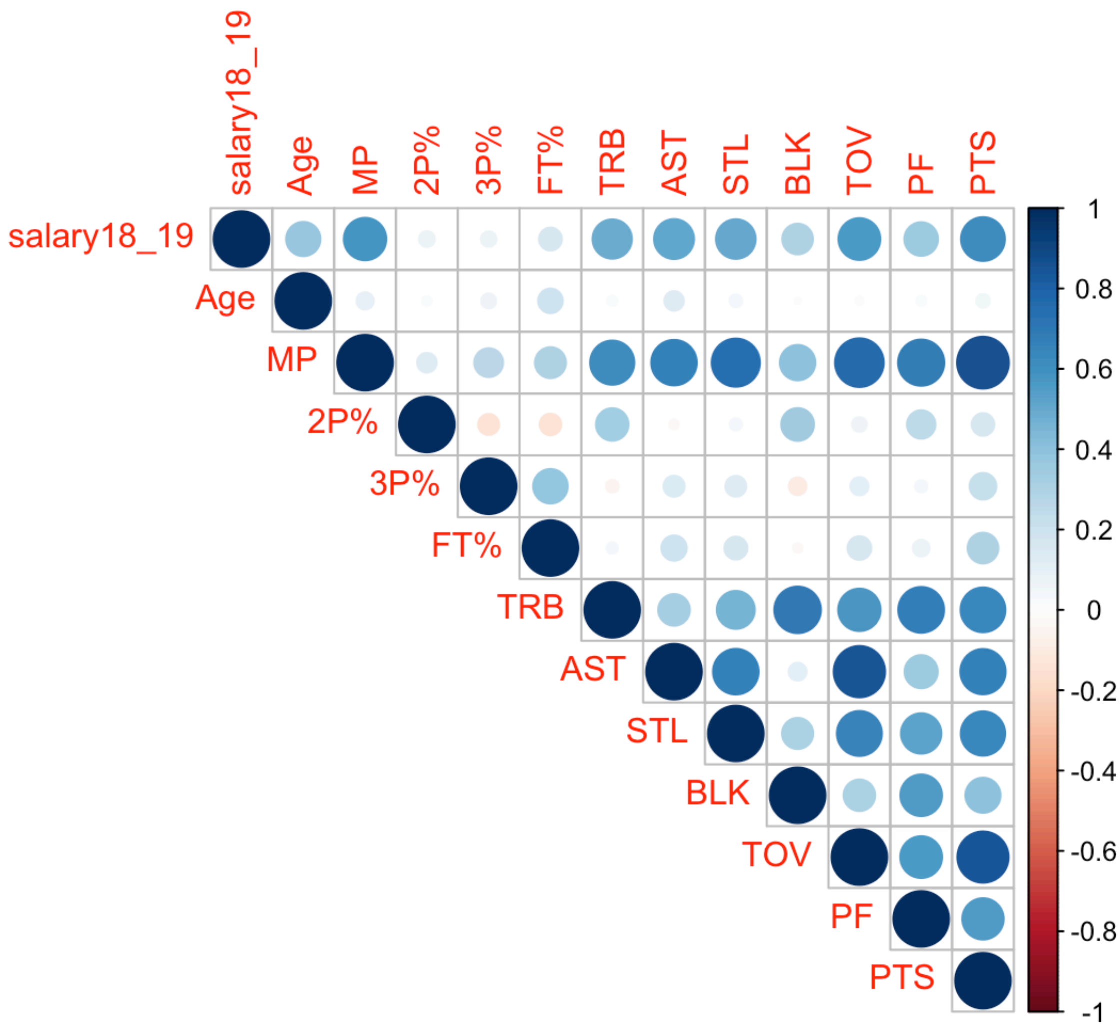
2.2.5 Save No_scale Data Into CSV

```
write.csv(stats_for_visualization,'18-19players_stat.csv')
```

3 Correlation Check

3.1 Frist Check

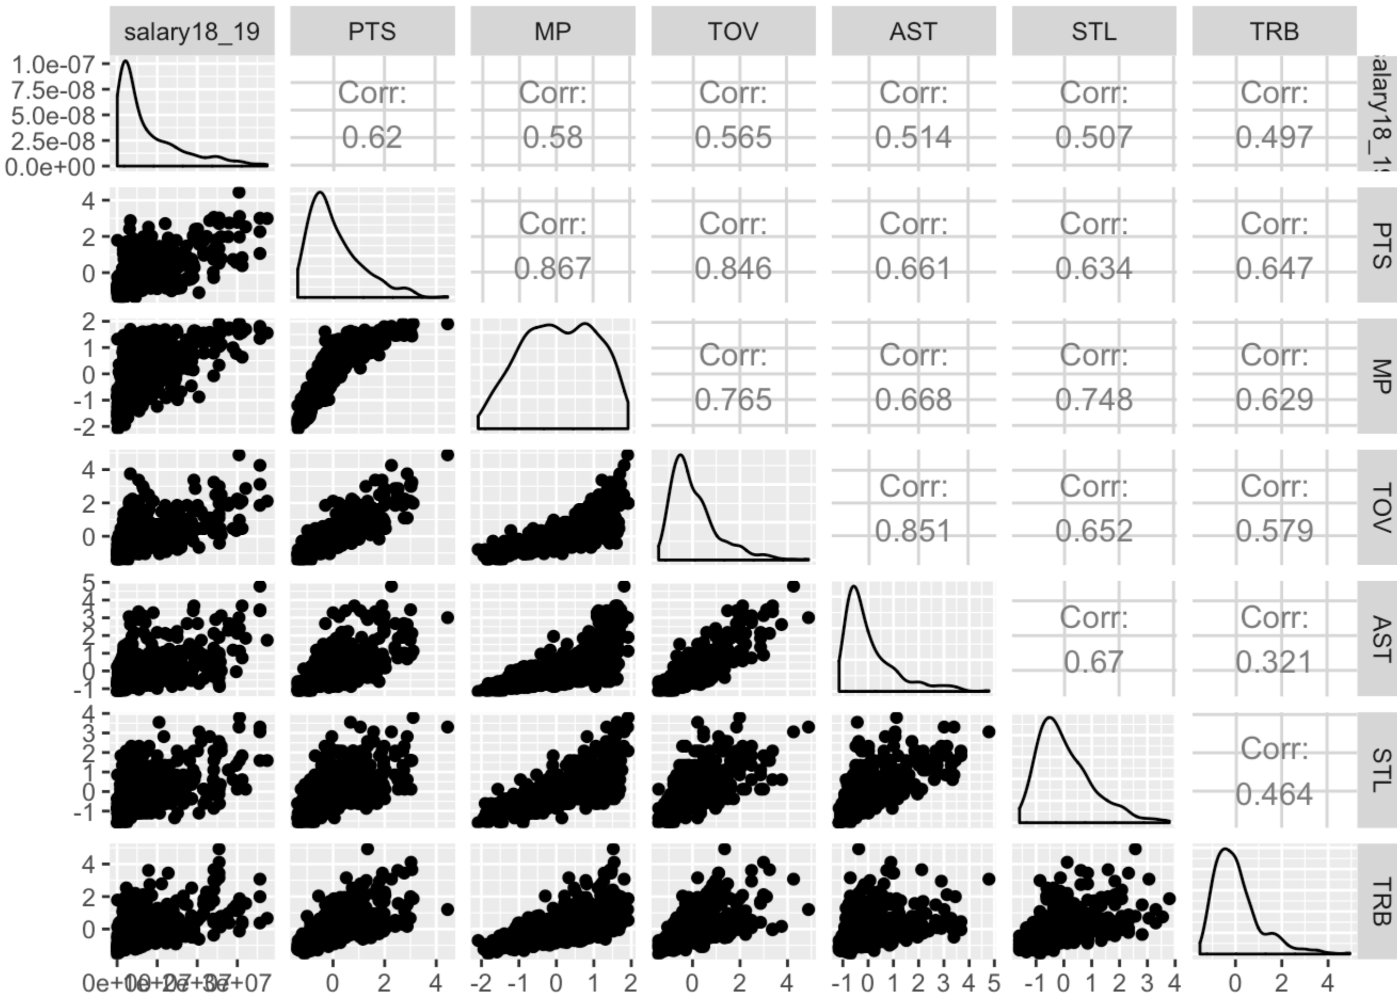
```
corrplot(cor(stats_scale %>%
               select(salary18_19, Age:PTS, contains("%")),
             use = "complete.obs"),
         method = "circle",type = "upper")
```



The features that have strong correlation with salary are:PTS,TOV,STL,AST,TRB and MP. Besides, MP is strongly correlated with multiple features and may have multiple collinearities(This is in line with our common sense. The more time we play, the better the data will be). What I didn't expect was that the correlation between field goal and salary was not high, that is to say, the output of players influenced the salary of players more than efficiency.

3.2 Second Check

```
stats_salary_cor <-
  stats_scale %>%
  select(salary18_19,PTS, MP, TOV, AST, STL, TRB)
ggpairs(stats_salary_cor)
```



```
cor(stats_salary_cor)[,"salary18_19"]
```

```
## salary18_19         PTS          MP         TOV         AST         STL
##   1.0000000   0.6198192   0.5803967   0.5645525   0.5142283   0.5066299
##         TRB
##   0.4972563
```

Correlation strength is: PTS > MP > TOV > AST > STL > TRB There's also one thing that surprises me: the number of players'turnivers is positively correlated with their salaries. I mean, generally speaking, assuming that a player's turnover rate is constant, the total number of turnovers will increase as his minutes played increases, and important players will have higher minutes played and higher salaries.

4 Data Visualization

4.1 Interactive Plot

```
names(stats_for_visualization )[4] <- "Team"
plot_ly(data = stats_for_visualization , x = ~salary18_19, y = ~PTS, color = ~Team,
        hoverinfo = "text",
        text = ~paste("Player: ", Player,
                      "<br>Salary: ", format(salary18_19, big.mark = ","),"$",
                      "<br>PTS: ", round(PTS, digits = 3),
                      "<br>Team: ", Team)) %>%
  layout(
    title = "Salary vs Points Per Game",
    xaxis = list(title = "Salary USD"),
    yaxis = list(title = "Points per Game")
  )
```

```
## No trace type specified:
##   Based on info supplied, a 'scatter' trace seems appropriate.
##   Read more about this trace type -> https://plot.ly/r/reference/#scatter
```

```
## No scatter mode specifed:
##   Setting the mode to markers

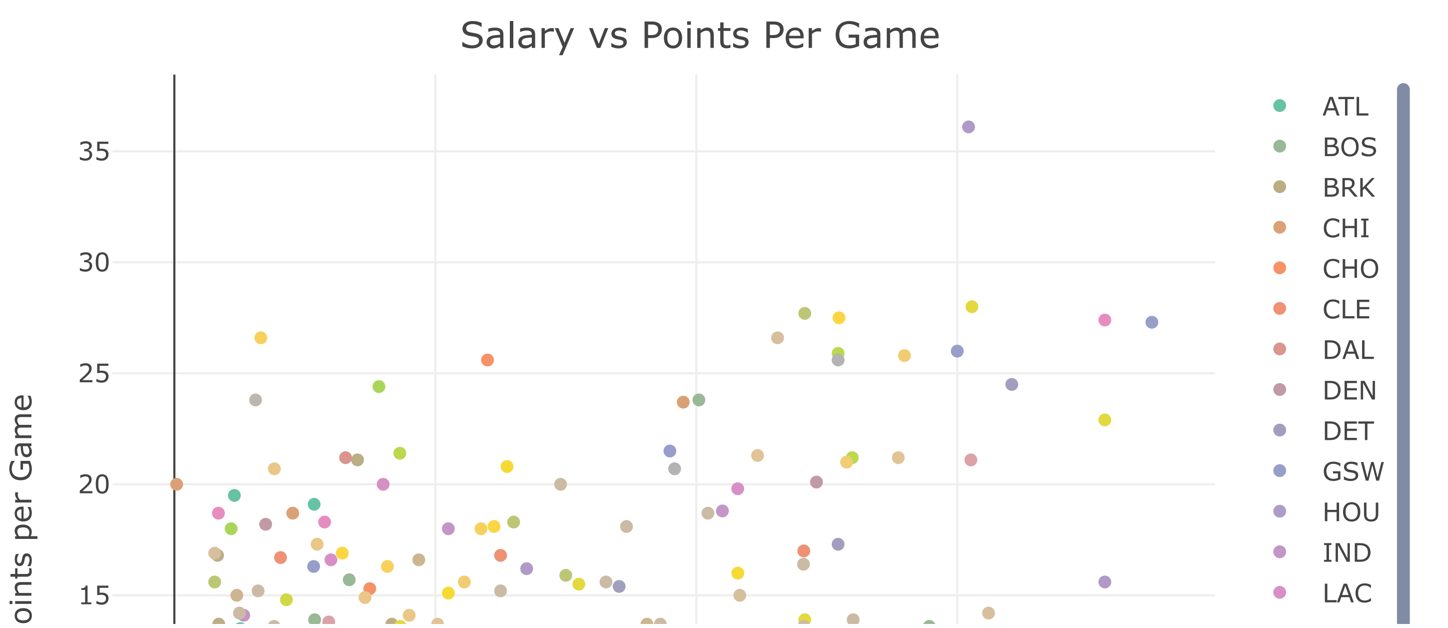
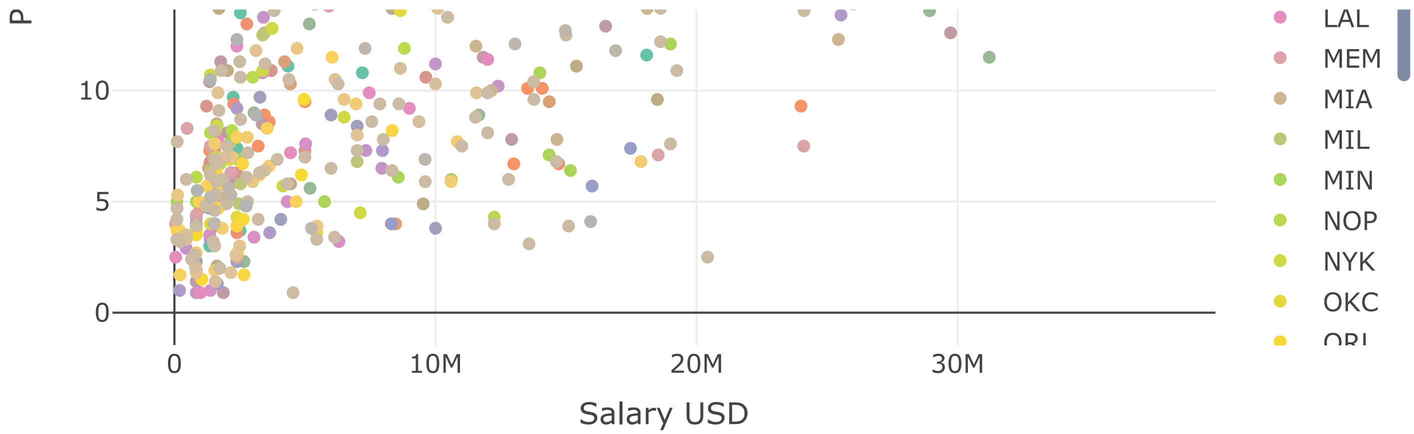
```

```
## Warning in RColorBrewer::brewer.pal(N, "Set2"): n too large, allowed maximum for p
alette Set2 is 8
## Returning the palette you asked for with that many colors

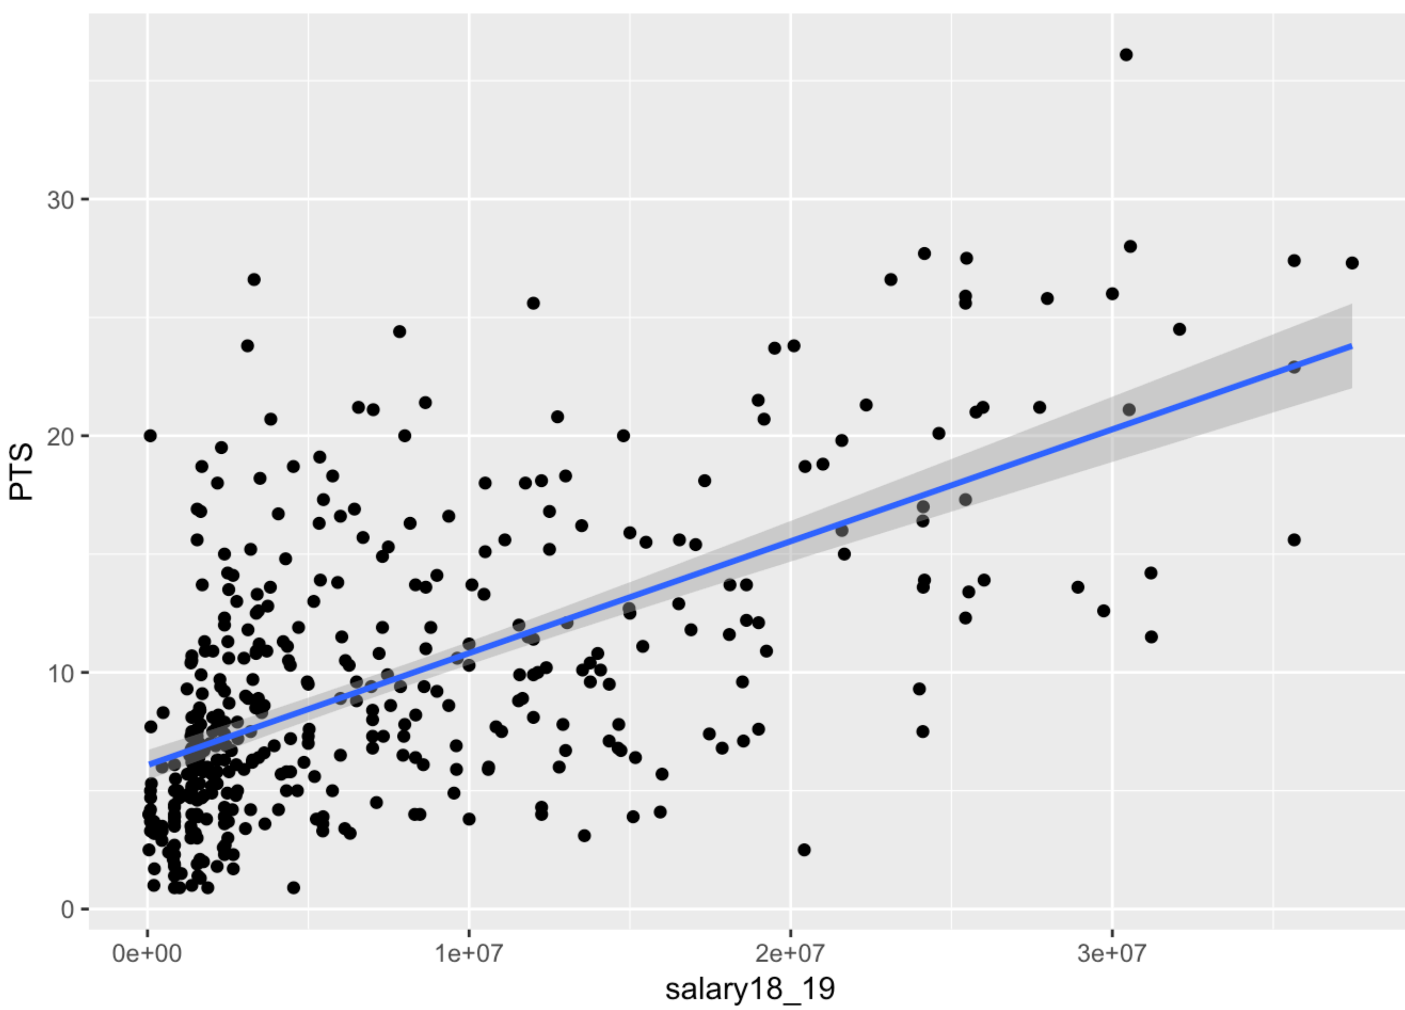
## Warning in RColorBrewer::brewer.pal(N, "Set2"): n too large, allowed maximum for p
alette Set2 is 8
## Returning the palette you asked for with that many colors
```





4.2 Scatter Plot With Regression Line

```
stats_for_visualization %>%
  ggplot(aes(x = salary18_19, y = PTS)) +
  geom_point() +
  geom_smooth(method = "lm")
```



Under the simple linear model, we can understand that the fitted curve represents the average level of the league, and the player below the curve performs worse than the expected performance corresponding to the salary. We can check their name by hovering on the points in the interactive plot. It includes a lot of All-Star players, such as Chris Paul, Kyle Lowry, Al Horford, Gordon Haywood(The Celtics are unlucky) and etc. However, it only considers the scoring feature, and does not fully reflect the players'influence on the field.

5 Multiple Regression

```
regression <- stats_scale %>% select(salary18_19,PTS, MP, TOV, AST, STL, TRB)
  lm(salary18_19~ PTS + MP + TOV + AST + STL + TRB, data =regression)
```

```
##
## Call:
## lm(formula = salary18_19 ~ PTS + MP + TOV + AST + STL + TRB,
##     data = regression)
##
## Coefficients:
## (Intercept)          PTS           MP          TOV          AST
##     7114340      3626578      -546186     -2022044      2571555
##         STL          TRB
##      833962      1888579
```

From here, we can see that points per game is the most significant feature of positive impact, while turnovers per game is the most significant feature of negative impact.

5.1 Player 's Importance And Incautiousness

Here we make two definitions that a player is "important" if his minutes played is above average and is "incautious" if his turnover per game is above average.

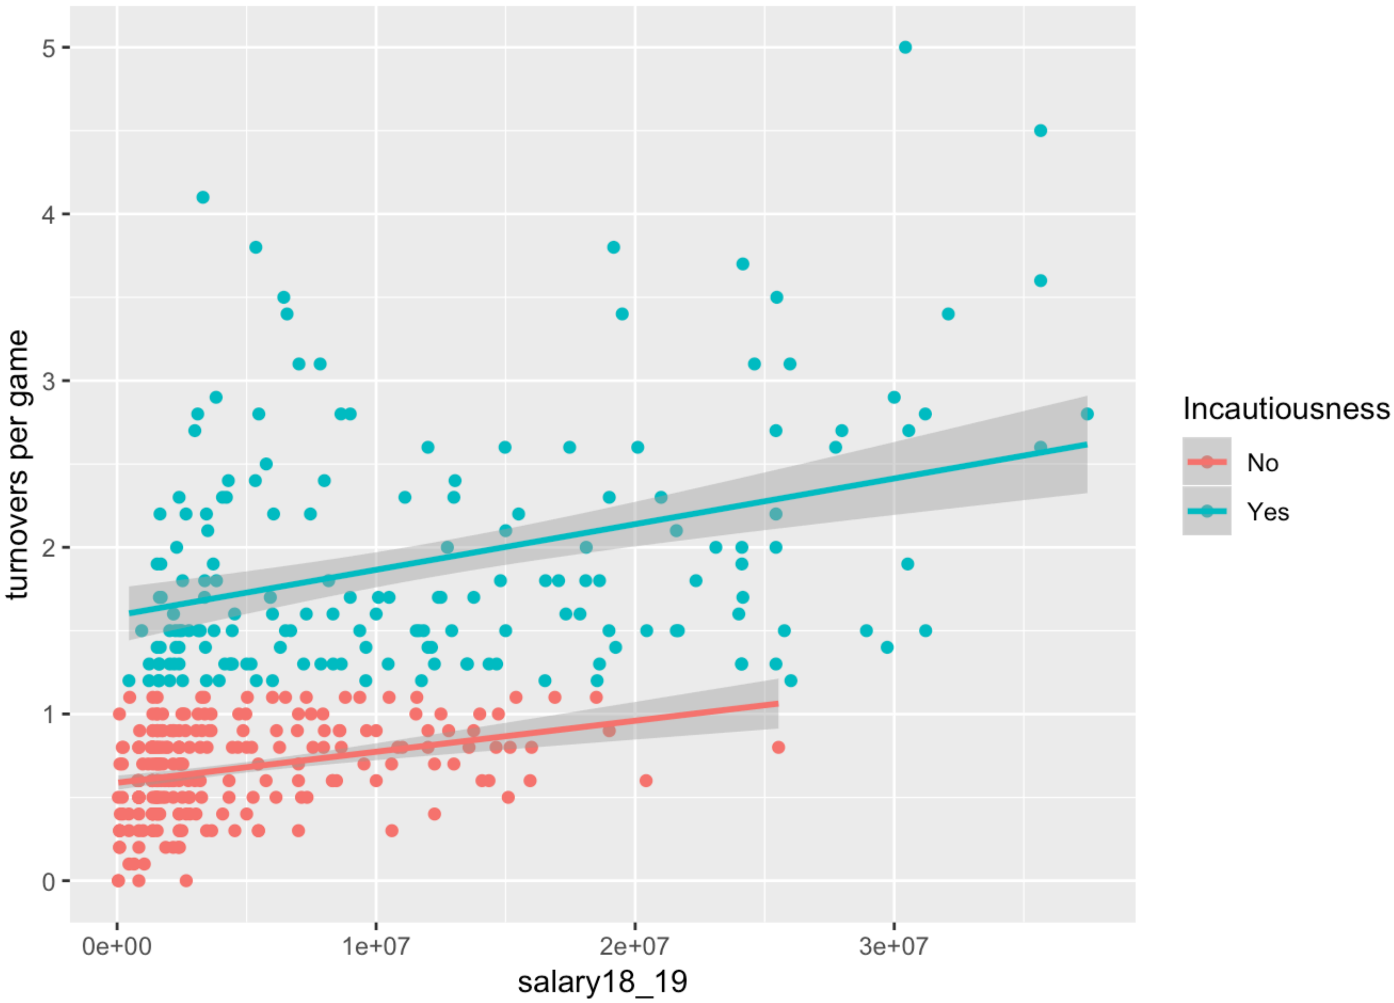
```
avg.minutes <- mean(regression$MP)
avg.turnover <- mean(regression$TOV)
regression$Importance<- as.factor(ifelse(regression$MP >= avg.minutes, "Yes", "No"))
regression$Incautiousness <- as.factor(ifelse(regression$TOV >= avg.turnover, "Yes",
"No"))
head(regression)
```

```
##   salary18_19         PTS         MP        TOV         AST        STL
## 1    21590909  1.12354560  1.5536855  1.2222684  0.90172692  0.1196179
## 2     1911960 -0.54308294 -0.8773917 -0.4188509 -0.20733649 -0.6151041
## 3     1378242 -0.85660712 -1.0518710 -0.9238106 -0.98368087 -0.8600115
## 4    28928710  0.72751506  0.9953519  0.4648288  1.17899277  0.6094326
## 5     6957105  0.03446161  0.9139283 -0.2926109 -0.42914917  0.3645252
## 6    11536515 -0.06454603  0.1229558 -0.1663710 -0.04097697 -0.1252894
##             TRB Importance Incautiousness
## 1  1.5363734745        Yes            Yes
## 2 -0.9949822302         No             No
## 3 -0.7459964232         No             No
## 4  1.2458900330        Yes            Yes
## 5  1.5778711090        Yes             No
## 6  0.0009609979        Yes             No
```

5.2 Prallel Slope Model

5.2.1 Incautiousness Comparision

```
regression %>%
  ggplot(aes(x = salary18_19, y = (TOV * var(player_season_tidy$TOV)^(1/2) + mean(pla
yer_season_tidy$TOV)), colour = Incautiousness)) +
  geom_point() +
  geom_smooth(method="lm")+
  ylab("turnovers per game")
```



It’s true that players with higher salaries make more turnovers. But the tendency is weak.

```
lm(formula = salary18_19 ~ Importance * Incautiousness, data=regression)
```

```
##
## Call:
## lm(formula = salary18_19 ~ Importance * Incautiousness, data = regression)
##
## Coefficients:
##                      (Intercept)                      ImportanceYes
##                          3275995                            3754147
##                IncautiousnessYes   ImportanceYes:IncautiousnessYes
##                          3048670                            3017297
```

This shows that when a player is important, he is paid more with fewer turnovers.

6 Conclusion

6.1 What i want to predict

As Lebron James fan, I am concerned about the new contract for the Lakers who may stay next season. Let’s find them first.

```
salaries_v4 %>% filter(Tm == "LAL" & `2019-20` == "")%>%
  select(Player)
```

```
## # A tibble: 8 x 1
## # Groups:   Player [8]
##   Player
##   <chr>
## 1 Kentavious Caldwell-Pope
## 2 Rajon Rondo
## 3 Mike Muscala
## 4 Lance Stephenson
## 5 Reggie Bullock
## 6 JaVale McGee
## 7 Andre Ingram
## 8 Scott Machado
```

```
Pope <- stats_scale %>% filter(Row.names == "Kentavious Caldwell-Pope")
Bullock <- stats_scale %>% filter(Row.names == "Reggie Bullock")
Stephenson <- stats_scale %>% filter(Row.names == "Lance Stephenson")
Pope
```

```
##                  Row.names        Age        MP       2P%       3P%
## 1 Kentavious Caldwell-Pope -0.2348656 0.5068101 0.4681242 0.3189064
##         FT%        TRB        AST       STL        BLK        TOV
## 1 0.9065815 -0.3310201 -0.4291492 0.6094326 -0.4974759 -0.4188509
##           PF       PTS salary18_19
## 1 -0.1395071 0.3644871     1.2e+07
```

6.2 Analysis conclusion

```
salary_prediction <- function(m, point, minutes, turn_over, assists, steals, rebounds
){
  pre_new <- predict(m, data.frame(PTS = point, MP = minutes, TOV= turn_over, AST= as
sists, STL= steals, TRB= rebounds))
  msg <- paste( "Expected Salary: $", format(round(pre_new), big.mark = ","), sep = "
")
  print(msg)
}
model <- lm(salary18_19~ PTS + MP + TOV + AST + STL + TRB, data =regression)
salary_prediction(model,Pope$PTS,Pope$MP,Pope$TOV,Pope$AST,Pope$STL,Pope$TRB)
```

```
## [1] "Expected Salary: $7,785,809"
```

```
salary_prediction(model,Bullock$PTS,Bullock$MP,Bullock$TOV,Bullock$AST,Bullock$STL,Bu
llock$TRB)
```

```
## [1] "Expected Salary: $7,126,513"
```

```
salary_prediction(model,Stephenson$PTS,Stephenson$MP,Stephenson$TOV,Stephenson$AST,St
ephenson$STL,Stephenson$TRB)
```

```
## [1] "Expected Salary: $5,286,590"
```

So Salaries for Pope, Bullock and Stephenson for next season are $7,785,809, $7,126,513 and $5,286,590
